In this tutorial, we are going to learn about how to check whether an npm package (or module) is installed globally or locally using the `npm list` command.

Checking globally installed packages

To check for all globally installed packages and its dependencies, run the `npm list` command followed by the `–g` flag.

```
npm list –g
```

How to solve the npm WARN package.json: No repository field

```
npm list -g --depth=0
```

You can also check if a specific package is installed globally or not using the `npm list -g` followed by package name.

```
npm list -g express
```

Checking locally installed packages

To check for all locally installed packages and their dependencies, navigate to the project folder in your terminal and run the `npm list` command.

```
npm list
```

To view the locally installed packages, without their dependencies use:

```
npm list --depth=0
```

You can also check if a specific package is installed locally or not using the `npm list` command followed by package name.

```
npm list react
```
